- A. It is used by all applications to control which user IDs can query for seedlist information.
- B. It is used by all applications that make widgets available within Communities.
- C. It is used by Profiles and Communities to retrieve user or community data.
- D. It is used as a system-level user for application-to-application communications.

Answer: C

QUESTION NO: 4

Which of the following statements describes the role of IBM Tivoli Directory Integrator in an IBM Connections 4.0 environment?

- A. It provides a mechanism for the underlying IBM WebSphere Application Server to authenticate against an LDAP directory.
- B. It provides a mechanism to populate the Profiles database with LDAP user information and to keep the same synchronized.

- C. It provides Connectors that allow IBM WebSphere Portal server to access various file-system directories on different systems.
- D. It provides a ready-made solution to keep multiple,supported LDAP directories synchronized.

Answer: B

QUESTION NO: 5

Kevin, the IBM Connections administrator, wants to enable IBM WebSphere Application Server administrative security. Which of the following statements about federated repositories is true?

- A. Connections 4.0 supports federated repositories,however the default file-based user registry must be deleted.
- B. Connections 4.0 supports federated repositories,and the default file based registry can coexist with as many additional LDAP user registriesas required.
- C. Connections 4.0 does not require a federated repository configuration as it supports a standalone LDAP repository.
- D. Connections 4.0 support for federated repositories provides the flexibility of allowing multiple users with the same user ID and distinguishedname (DN).

Answer: B

QUESTION NO: 6

Which statement about the IBM Connections database wizard is true?

- A. Besides creating Connections databases,it can also upgrade IBM DB2 to the latest version,provided the install files are located on the samefile system.
- B. Besides creating Connections databases,it can also be used to migrate from one database server to another.
- C. Connections databases can be created locally as well as remotely.
- D. It can only be used to create,update and remove Connections databases.

Answer: D

QUESTION NO: 7

While installing IBM WebSphere Application Server Network Deployment, what is the correct approach for enabling global security?

- A. Always set the administrator name / password to wasadmin / wasadmin as the installation scripts have been written to recognize this name andpassword.

- B. The administrator name provided during the installation can be any value so long as the same name exists in the LDAP repository.
- C. The administrator name provided during the installation must be a unique value and should not exist in the LDAP repository.
- D. Do nothing, the installation process automatically assigns an administrator name and password combination, displays it upon successful installation and also writes that information to the install logs.

Answer: C

QUESTION NO: 8

Charlie is preparing to perform an IBM Connections 4.0 installation. What does he need to know about a failed Connections 4.0 installation?

- A. IBM Installation Manager cancels the installation and rolls back the installation files. Charlie should fix the condition causing the failure, restore the Deployment Manager profile to a clean state, delete the Connections_root directory and restart the installation.
- B. IBM Installation Manager cancels the installation. Charlie should run the uninstall.[bat/sh] file that gets copied to the Connections_root/uninstall directory first, fix the condition causing the installation to fail, restore the Deployment Manager profile to a clean state, delete the Connections_root directory and restart the installation.
- C. IBM Installation Manager cancels the installation and rolls back the install files. It also restores the Deployment Manager profile to a clean state. Charlie should just restart the Deployment Manager, fix the condition causing the failure, delete the Connections_root directory and restart the installation.
- D. IBM Installation Manager has advanced capabilities with which it takes a snapshot of the Deployment Manager profile first. Upon failure, it rolls back the installation file and reverts to a clean Deployment Manager profile. Charlie should just fix the condition causing the failure and restart the installation.

Answer: A

QUESTION NO: 9

Francis, the IBM WebSphere administrator has the option of installing IBM Connections 4.0 on either Linux or Windows operating system. Which statement is true about access requirements from an operating system perspective?

- A. On Windows, any user will be able to install Connections so long as the administrator has shared the target installation directories with FullControl permissions. On Linux, a non-root install is not possible.
- B. On Linux, a non-root user can be granted required access permissions to certain data

directories thereby allowing non-root installs. On Windows, only a local administrator can install Connections 4.0.

C. Both on Windows and Linux, a non-administrator or non-root user can perform Connections installs, so long as proper access permissions are granted to the required target directories.

D. On Linux, a non-root user can be granted required access permissions to certain data directories thereby allowing non-root installs. On Windows, especially in Windows 2008, the administrator account must be a domain administrator in order to install Connections 4.0.

Answer: B

QUESTION NO: 10
